3	Maximum Likelihood Solution	2

This document describes a solution for weighted least squares in a heteroscedastic setting.

1 LIKELIHOOD AND PRIOR

We assume that the response variable t_n is approximated by a Gaussian distribution with mean $\mathbf{w}^\top \mathbf{x}_n$ and variance $\sigma^2(\mathbf{x}_n)$ in a heteroscedastic setting. Thus, the likelihood for a single datapoint (\mathbf{x}_n, t_n) is

$$\begin{aligned} \Pr(t_n | \mathbf{x}_n; \mathbf{w}, \sigma^2(\mathbf{x}_n)) &= \mathcal{N}(t_n | \mathbf{w}^\top \mathbf{x}_n, \sigma^2(\mathbf{x}_n)) \\ &= \frac{1}{\sqrt{2\pi\sigma^2(\mathbf{x}_n)}} \exp\left(-\frac{(t_n - \mathbf{w}^\top \mathbf{x}_n)^2}{2\sigma^2(\mathbf{x}_n)}\right) \end{aligned} \quad (1)$$

For the prior we assume that \mathbf{w} is drawn from a multivariate Gaussian distribution, that is,

$$\begin{aligned} \Pr(\mathbf{w}) &= \mathcal{N}(\mathbf{w} | \boldsymbol{\mu}, \boldsymbol{\Sigma}) \\ &= \frac{1}{\sqrt{(2\pi)^D |\boldsymbol{\Sigma}|}} \exp\left(-\frac{1}{2} (\mathbf{w} - \boldsymbol{\mu})^\top \boldsymbol{\Sigma}^{-1} (\mathbf{w} - \boldsymbol{\mu})\right). \end{aligned} \quad (2)$$

where D is the dimension of \mathbf{w} .

2 ML AND MAP OBJECTIVE FUNCTIONS

Considering a dataset \mathcal{D} of N independent and identically distributed samples $(\mathbf{x}_i, \sigma^2(\mathbf{x}_i), t_i)$, $1 \leq i \leq N$, the ML objective using (1) is

$$\hat{\mathbf{w}}_{ML} = \underset{\mathbf{w}}{\operatorname{argmax}} \log \Pr(\mathcal{D} | \mathbf{w}) \quad (3)$$

$$= \underset{\mathbf{w}}{\operatorname{argmax}} \log \prod_{i=1}^N \Pr(t_i | \mathbf{x}_i; \mathbf{w}, \sigma^2(\mathbf{x}_i)) \quad (4)$$

$$= \underset{\mathbf{w}}{\operatorname{argmax}} \sum_{i=1}^N \log \Pr(t_i | \mathbf{x}_i; \mathbf{w}, \sigma^2(\mathbf{x}_i)) \quad (5)$$

$$= \underset{\mathbf{w}}{\operatorname{argmax}} \sum_{i=1}^N -\frac{1}{2} \log(2\pi\sigma^2(\mathbf{x}_i)) - \frac{(t_i - \mathbf{w}^\top \mathbf{x}_i)^2}{2\sigma^2(\mathbf{x}_i)} \quad (6)$$

$$= \underset{\mathbf{w}}{\operatorname{argmin}} \frac{1}{2} \sum_{i=1}^N \frac{(t_i - \mathbf{w}^\top \mathbf{x}_i)^2}{\sigma^2(\mathbf{x}_i)}. \quad (7)$$

On the other hand, using (1), (2), and (7), the MAP objective becomes

$$\hat{\mathbf{w}}_{MAP} = \underset{\mathbf{w}}{\operatorname{argmax}} \log \Pr(\mathbf{w} | \mathcal{D}) \quad (8)$$

$$= \underset{\mathbf{w}}{\operatorname{argmax}} \log \left(\frac{\Pr(\mathcal{D} | \mathbf{w}) \Pr(\mathbf{w})}{\Pr(\mathcal{D})} \right) \quad (9)$$

$$= \underset{\mathbf{w}}{\operatorname{argmax}} \log \Pr(\mathcal{D} | \mathbf{w}) \Pr(\mathbf{w}) \quad (10)$$

$$= \underset{\mathbf{w}}{\operatorname{argmax}} \log \Pr(\mathcal{D} | \mathbf{w}) + \log \Pr(\mathbf{w}) \quad (11)$$

$$\begin{aligned} &= \underset{\mathbf{w}}{\operatorname{argmin}} \left(\frac{1}{2} \sum_{i=1}^N \frac{(t_i - \mathbf{w}^\top \mathbf{x}_i)^2}{\sigma^2(\mathbf{x}_i)} \right. \\ &\quad \left. + \frac{1}{2} (\mathbf{w} - \boldsymbol{\mu})^\top \boldsymbol{\Sigma}^{-1} (\mathbf{w} - \boldsymbol{\mu}) \right). \end{aligned} \quad (12)$$

Note that taking $\boldsymbol{\mu} = \mathbf{0}$ and $\boldsymbol{\Sigma} = \lambda^{-1} \mathbf{I}$ gives

$$\hat{\mathbf{w}}_{MAP} = \underset{\mathbf{w}}{\operatorname{argmin}} \frac{1}{2} \sum_{i=1}^N \frac{(t_i - \mathbf{w}^\top \mathbf{x}_i)^2}{\sigma^2(\mathbf{x}_i)} + \frac{\lambda}{2} \|\mathbf{w}\|^2 \quad (13)$$

which is the objective function for *regularized weighted least squares* method.

3 MAXIMUM LIKELIHOOD SOLUTION

Defining

$$r_n = \frac{1}{\sigma^2(\mathbf{x}_n)} \quad (14)$$

$$\boldsymbol{\phi}(\mathbf{x}_n) = \mathbf{x}_n \quad (15)$$

then from (7), the sum of squares error function becomes

$$E_{\mathcal{D}}(\mathbf{w}) \triangleq \frac{1}{2} \sum_{i=1}^N r_n \{t_n - \mathbf{w}^\top \boldsymbol{\phi}(\mathbf{x}_n)\}^2. \quad (16)$$

where $r_n > 0 \forall 1 \leq n \leq N$.

Notice that (16) can be written as

$$E_{\mathcal{D}}(\mathbf{w}) = \frac{1}{2} (\mathbf{y} - \mathbf{X}^\top \mathbf{w})^\top \mathbf{R} (\mathbf{y} - \mathbf{X}^\top \mathbf{w}). \quad (17)$$

where

$$\mathbf{y} \triangleq (y_1 \ y_2 \ \dots \ y_N)^\top \quad (18)$$

$$\mathbf{X} \triangleq (\mathbf{X}_1 \ \mathbf{X}_2 \ \dots \ \mathbf{X}_n) \quad (19)$$

$$\mathbf{R} \triangleq \text{diag}(r_1 \ r_2 \ \dots \ r_n). \quad (20)$$

Taking the gradient of (17) and setting it to $\mathbf{0}$ gives (where we note that \mathbf{R} is symmetric.)

$$-(\mathbf{y} - \mathbf{X}^\top \mathbf{w})^\top \mathbf{R} \mathbf{X}^\top = \mathbf{0} \quad (21)$$

$$\mathbf{X} \mathbf{R} \mathbf{X}^\top \mathbf{w} = \mathbf{X} \mathbf{R} \mathbf{y} \quad (22)$$

$$\implies \hat{\mathbf{w}}_{ML} = (\mathbf{X} \mathbf{R} \mathbf{X}^\top)^{-1} \mathbf{X} \mathbf{R} \mathbf{y} \quad (23)$$
